CPSC 314 Assignment 1 Due Mon Sept 16, 2019

Introduction to Three.js, and GLSL shaders (5% of final grade)

In this assignment you will gain basic experience with Three.js and GLSL shaders. Outcomes include the ability to:
– run WebGL code based on Three.js;
– debug basic javascript errors and shader errors;
– modify basic 3D scenes in Three.js; defining a custom 3D object;
– make simple modifications to a fragment shader.

Copy and expand the zip file in a local "cs314" directory for this assignment:

```
cp a1.zip ~/cs314/a1.zip
cd ~/cs314
unzip a1.zip
```

Files include:

– `a1.html`:	vertex-shader and fragment-shader code; runs `a1.js`
– `a1.js`:	main javascript code
– `obj/armadillo.obj`:	3D model vertices (`v`), vertex normals (`vn`), and triangles (`f`)
– `images/floor.jpg`:	image that appears on the rendered floor square
– `js/*.js`:	three.js libraries and other supporting code

Enabling local file access

View your local version of `a1.html` to ensure that your web browser is properly enabled to run Javascript and WebGL. Chrome, Firefox, and Safari all support WebGL. If you get a blank image, black floor, or you are missing a rendered Armadillo when launching `a1.html`, this likely means that your browswer has not been enabled to access local files. For your own machine, the fix depends on your OS and your browser.
Firefox does not require any special steps on the lab machines. Chrome can be opened with the `--allow-file-access-from-files` flag from the command line, although be aware that this opens a security loophole when browsing the web. It is also simple to install a local http server, i.e., see: `https://www.npmjs.com/package/http-server`. This can be launched from your assignment 1 directory using

```
http-server .  -p 8000
```

Then use `http://localhost:8000/a1.html` as your URL.
See also `threejs.org -> documentation -> How to run things locally`.

Assignment steps

Now walk through the following steps, and implement the requested changes. After each edit to `a1.html`, `a1.js`, or to a GLSL shader file, you will want to reload `a1.html` in order to see the changed result. When introducting errors, fix the error before moving on to the next step. All other changes can be made in a cumulative fashion.

1. Introduction to Three.js and Shaders (12 points total)

   Parts (a)-(h), (m-o), are worth 3 points taken altogether. There is nothing to hand-in here, but you should be prepared to discuss these with your TA.

   (a) Run the code by launching `a1.html`. Open the console window (Ctrl+Shift+J Windows / Linux, or Cmd+Opt+J Mac). Look for the "hello world" message. Change the console message to "Assignment 1 (FOO)", where FOO is your name.

   (b) Attempt to print the result of a division by zero. What happens?

   (c) Attempt to use a variable name that does not exist yet. What happens?

   (d) Add a new variable using "var foo;" and then print it's value without first initializing it. What happens?

   (e) Remove the terminating semicolon from one of the early lines in a1.js. What happens? Why? Do a web search on "use of semicolon in javascript" to understand why you should still use terminating semicolons.

   (f) Insert the following code at the beginning of a1.js. What are the resulting values of a and b? Why?

   ```
   a=4;  b=5;
   function go() {
     var a = 14;   b = 15;  }
   go();    console.log('a=',a,'b=',b);
   ```

   (g) Change the background colour to be light purple.

   (h) Know how to orbit, pan, and zoom in the scene. This is done via left-mouse-drag, right-mouse-drag, and mouse-wheel. On a Mac trackpad: click-drag, two-finger click-drag, two-finger drag, respectively.

   (i) (1 point) Change the custom object, which is currently a white square, to be a set of orange vertical walls that form a triangular room when seen from above. Modify the properties of the material as needed.

   (j) (1 point) Create an instance of a second torus. Change the orientation so that it is parallel to the ground. Change the position so that the first torus and second torus are linked together, like links in a chain.

   (k) (1 point) Build a twisting stack of three cubes, coloured yellow, blue, and pink (from bottom to top).

   (l) (1 point) The light source, shown as a red sphere, can currently be moved using the W,A,S,D keys. Change the code so that the movement of the light source is bounded to $x, y \in [-5, 5]$. Make the light source yellow.

(m) Edit the Armadillo geometry. First, make a commented copy (by adding a leading '#' sign) of the line containing the first vertex. Then change the coordinates of the first vertex to (1,1,1). View the result to see where the first vertex is located. Then change the first vertex back to its orginal value.

(n) The Armadillo has its own vertex shader and fragment shader programs, given in `a1.html`. We will be experiment with making a few small changes to the fragment shader. First, remove a semicolon from one of the fragment shader statements. What happens? Look at the console log. Add the semicolon back in.

(o) Save a copy of the key line in the current fragment shader, i.e., `gl_FragColor = ...`. Now change the fragment shader to shade all pixels of the Armadillo green. Preserve this change as a comment in your shader.

(p) (2 points) Change the fragment shader to render the intensity according to light coming from a fixed direction. In the shader, define a lighting direction, L=(0.0,0.0,-1.0), that points towards the light. The decimal values are important here, because otherwise the numbers will be interpreted as integers. Now define a float, i, computed to give a diffuse lighting model, N dot L. GLSL provides a function `dot(`a`,`b`)` that computes $a \cdot b$. Assign the computed intensity, i, to each of the red, green, and blue components of the final fragment, to produce a grey-shaded armadillo.

(q) **(3 points) Creative Component:** Make several further changes and additions to your scene to make it interesting. The most compelling scenes will be shown in class. You are free to experiment with any-and-all features. Include a README.txt file that summarizes your work here. However, be sure to give attribution if you borrow from existing three.js code online.

Submit your assignment by the deadline using: `handin cs314 a1` on the undergrad Linux machines, or you also use web handin:

`https://www.students.cs.ubc.ca/cgi-bin/protected/handin`.

Show your demo to a TA in your lab section, or during the extra lab hours (to be arranged). You should be able to answer questions related to the various experiments you performed above.
